FIXED POINTS IN FUZZY METRIC SPACE FOR NONCOMPATIBLE MAPS

BY

VYOMESH PANT$^{1,2}$ AND R. P. PANT$^1$

Abstract. The present paper is aimed at obtaining common fixed point theorems in fuzzy metric space for a pair of selfmaps by using the notion of pointwise $R$-weak commutativity but without assuming the completeness of the space or continuity of the mappings involved. We also find an affirmative answer in fuzzy metric space to the problem of Rhoades (see page 245 in [16]).

1. Introduction

The concept of fuzzy sets was coined by Zadeh [19] in his seminal paper in 1965. Thereafter the concept of fuzzy metric space has been introduced and generalized in different ways by Deng [3], Erceg [5], Kaleva and Seikkala [9], Kramosil and Michalek [7], George and Veeramani [6] etc. It has also been shown that every metric induces a fuzzy metric (see Example 1 below). In 1988, Grabiec [7] extended the fixed point theorems of Banach [2] and Edelstein [4] to fuzzy metric spaces. Following Grabiec [7] and Kramosil and Michalek [8], Mishra et al [10] obtained common fixed point theorems for compatible maps and asymptotically commuting maps on fuzzy metric space. A number of fixed point theorems have been obtained by various authors in fuzzy metric spaces by using the notion of compatibility of maps or by using its generalized or weaker forms.
In the study of fixed points of metric spaces, Pant [11, 12, 14] has initiated work using the concept of noncompatible maps in metric spaces. Recently Aamri and Moutawakil [1] introduced the property \((E.A)\) and thus generalized the concept of noncompatible maps. The results obtained in the fuzzy metric fixed point theory by using the notion of noncompatible maps or the property \((E.A)\) are very interesting. Question arises whether, by using the concept of noncompatibility or its generalized notion, that is, the property \((E.A)\), can we find equally interesting results in fuzzy metric spaces also? We answer in affirmative. In the present paper we prove common fixed point theorems for \(R\)-weakly commuting maps of type \((A_g)\) in fuzzy metric space by using the concept of noncompatibility, however, without assuming either the completeness of the space or the continuity of the mappings involved. We also find an answer in fuzzy metric space to the problem of Rhoades [16].

In 1994 Pant [13] introduced the concept of \(R\)-weakly commuting maps in metric spaces. Later Pathak et al. [15] generalized this aspect and gave the concept of \(R\)-weakly commuting maps of type \((A_g)\). Vasuki [18] proved some common fixed point theorems for \(R\)-weakly commuting maps in the fuzzy metric space. Here we define the notion of \(R\)-weakly commuting maps of type \((A_g)\) and the property \((E.A)\) in the fuzzy metric space and then prove common fixed point theorems for a pair of selfmaps.

Before we start we give some preliminaries.

**Definition 1.1.** ([20]) Let \(X\) be any set. A fuzzy set \(A\) in \(X\) is a function with domain \(X\) and values in \([0, 1]\).

**Definition 1.2.** ([18]) A binary operation \(\ast\) : \([0, 1] \times [0, 1] \to [0, 1]\) is called a continuous \(t\)-norm if \(([0, 1], \ast)\) is an abelian topological monoid with the unit 1 such that \(a \ast b \leq c \ast d\) whenever \(a \leq c\) and \(b \leq d\) for all \(a, b, c, d \in [0, 1]\).

**Definition 1.3.** ([6]) The 3-tuple \((X, M, \ast)\) is called a fuzzy metric space if \(X\) is an arbitrary set, \(\ast\) is a continuous \(t\)-norm and \(M\) is a fuzzy set in \(X^2 \times [0, \infty)\) satisfying the following conditions for all \(x, y, z \in X\) and \(t, s > 0\).

(i) \(M(x, y, 0) > 0\)

(ii) \(M(x, y, t) = 1\) for all \(t > 0\) if and only if \(x = y\)

(iii) \(M(x, y, t) = M(y, x, t)\)
(iv) \( M(x, y, t) \ast M(y, z, s) \leq M(x, z, t + s) \)
(v) \( M(x, y, .) : [0, 1) \to [0, 1] \) is continuous.

**Definition 1.4.**([10]) Let \( A \) and \( B \) map from a fuzzy metric space \((X, M, \ast)\) into itself. The maps \( A \) and \( B \) are said to be **compatible** (or **asymptotically commuting**), if for all \( t > 0 \),

\[
\lim_{n} M(ABx_n, BAx_n, t) = 1.
\]
Whenever \( \{x_n\} \) is a sequence in \( X \) such that \( \lim_{n \to \infty} Ax_n = \lim_{n \to \infty} Bx_n = z \) for some \( z \in X \).

From the above definition it is inferred that \( A \) and \( B \) are noncompatible maps from a fuzzy metric space \((X, M, \ast)\) into itself if \( \lim_{n \to \infty} Ax_n = \lim_{n \to \infty} Bx_n = z \) for some \( z \in X \), but either \( \lim_{n} M(ABx_n, BAx_n, t) \neq 1 \) or the limit does not exist.

**Definition 1.5.**([13]) Two maps \( A \) and \( S \) are called **R-weakly commuting at a point** \( x \) if \( d(ASx, SAx) \leq Rd(Ax, Sx) \) for some \( R > 0 \). \( A \) and \( S \) are called **pointwise R-weakly commuting on** \( X \) if given \( x \) in \( X \), there exists \( R > 0 \) such that \( d(ASx, SAx) \leq Rd(Ax, Sx) \).

**Definition 1.6.**([18]) Two mappings \( A \) and \( S \) of a fuzzy metric space \((X, M, \ast)\) into itself are **R-weakly commuting** provided there exists some real number \( R \) such that

\[
M(ASx, SAx, t) \geq M(Ax, Sx, t/R) \text{ for each } x \in X \text{ and } t > 0.
\]

**Definition 1.7.**([15]) Two selfmappings \( A \) and \( S \) of a metric space \((X, d)\) are called **R-weakly commuting of type (A\_g)** if there exists some positive real number \( R \) such that

\[
d(AAx, SAx) \leq Rd(Ax, Sx) \text{ for all } x \text{ in } X.
\]

**Definition 1.8.**([1]) Let \( f \) and \( g \) be two selfmappings of a metric space \((X, d)\). We say that \( A \) and \( S \) satisfy the property \((E.A)\) if there exists a sequence \( \{x_n\} \) such that

\[
\lim_{n \to \infty} Ax_n = \lim_{n \to \infty} Sx_n = t \text{ for some } t \in X.
\]
We define the following:

**Definition 1.9.** Two mappings $A$ and $S$ of a fuzzy metric space $(X, M, *)$ into itself are $R$-weakly commuting of type $(A_g)$ provided there exists some real number $R$ such that

$$M(AAx, SAx, t) \geq M(Ax, Sx, t/R)$$

for each $x \in X$ and $t > 0$.

**Definition 1.10.** Let $f$ and $g$ be two selfmappings of a fuzzy metric space $(X, M, *)$. We say that $A$ and $S$ satisfy the property $(E.A)$ if there exists a sequence $\{x_n\}$ such that

$$\lim_{n \to \infty} Ax_n = \lim_{n \to \infty} Sx_n = t$$

for some $t \in X$.

**Example 1.** ([6]) Let $(X, d)$ be a metric space. Define $a * b = ab$ or $a * b = \min\{a, b\}$ and for all $x, y \in X, t > 0$

$$M(x, y, t) = \frac{t}{t + d(x, y)}.$$

Then $(X, M, *)$ is a fuzzy metric space and the fuzzy metric $M$ induced by the metric $d$ is often referred to as the standard fuzzy metric.

### 2. Results

**Theorem 1.** Let $f$ and $g$ be pointwise $R$-weakly commuting selfmappings of a fuzzy metric space $(X, M, *)$ satisfying the property $(E.A)$ and

(i) $fX \subset gX$,

(ii) $M(fx, fy, kt) \geq M(gx, gy, t)$, $k \geq 0$, and

(iii) $M(fx, f^2x, t) > \max\{M(gx, gf x, t), M(fx, gx, t), M(f^2x, gf x, t), M(fx, gf x, t), M(gx, f^2x, t)\}$, whenever $fx \neq f^2x$.

If the range of $f$ or $g$ is a complete subspace of $X$, then $f$ and $g$ have a common fixed point.

**Proof.** Since $f$ and $g$ are satisfy the property $(E.A)$, there exists a sequence $\{x_n\}$ in $X$ such that

(1) $\lim_n fx_n = \lim_n gx_n = p$
for some \( p \) in \( X \). Since \( p \in fX \) and \( fX \subset gX \), there exists some point \( u \) in \( X \) such that \( p = gu \) where \( p = \lim_n gx_n \). If \( fu \neq gu \), the inequality
\[
M(fx_n, fu, kt) \geq M(gx_n, gu, t)
\]
on letting \( n \to \infty \) yields
\[
M(gu, fu, kt) \geq M(gu, gu, t).
\]
Hence \( fu = gu \).

Since \( f \) and \( g \) are \( R \)-weak commutating, there exists \( R > 0 \) such that
\[
M(fgu, gfu, t) \geq M(fu, gu, t/R) = 1,
\]
that is, \( fgu = gfu \) and \( ffu = fgu = gfu = ggu \). If \( fu \neq ffu \), using (iii), we get
\[
M(fu, ffu, t) > \max\{M(gu, gfu, t), M(fu, gu, t), M(ffu, gfu, t), M(ffu, gfu, t), M(gu, ffu, t)\} = M(fu, ffu, t),
\]
a contradiction. Hence, \( fu = ffu \) and \( fu = ffu = fgu = gfu = ggu \).

Hence \( fu \) is a common fixed point of \( f \) and \( g \). The case when \( fX \) is a complete subspace of \( X \) is similar to the above case since \( fX \subset gX \). Hence we have the theorem.

We now give an example to illustrate the above theorem.

**Example 2.** Let \( X = [2, 20] \) and \( M \) be the usual fuzzy metric on \((X, M, *)\). Define \( f, g : X \to X \) as
\[
fx = 2 \text{ if } x = 2 \text{ or } 5, \quad fx = 6 \text{ if } 2 < x \leq 5
\]
\[
g2 = 2, \quad gx = x + 4 \text{ if } 2 < x \leq 5, \quad gx = (4x + 10)/15 \text{ if } x > 5
\]
also we define \( M(fx, gy, t) = t/[t + d(fx, gy)] \) for all \( x, y \) in \( X \) and \( t > 0 \). Then \( f \) and \( g \) satisfy all the conditions of the above theorem and have a common fixed point at \( x = 2 \).

In this example \( fX = \{2\} \cup \{6\} \) and \( gX = [2, 6] \cup \{7\} \). It may be seen that \( fX \subset gX \). It can be verified also that \( f \) and \( g \) are pointwise \( R \)-weakly commuting maps and satisfy the \((E.A)\) property.
Setting $k = 1$ in the above theorem we get the following theorem:

**Theorem 2.** Let $f$ and $g$ be pointwise $R$-weakly commuting selfmappings of a fuzzy metric space $(X, M, *)$ satisfying the property (E.A) and

(i) $fX \subset gX$,
(ii) $M(fx, fy, t) \geq M(gx, gy, t)$, and
(iii) $M(fx, f^2x, t) > \max\{M(gx, gf x, t), M(fx, gx, t), M(f^2x, gf x, t), M(fx, g f x, t), M(gx, f^2x, t)\}$, whenever $fx \neq f^2x$.

If the range of $f$ or $g$ is a complete subspace of $X$, then $f$ and $g$ have a common fixed point.

Theorem 1, *ibid*, has been proved by using the concept of (E.A) property which has been introduced in a recent work by Aamri and Moutawakil [1]. They have shown that the (E.A) property is more general than the notion of noncompatibility. It may, however, be observed that by using the notion of noncompatible maps in place of the (E.A) property, we can not only prove the Theorem 1 above, but, in addition, we are able to show also that maps are discontinuous at their common fixed point. We do this in our next theorem and thus find out an answer in fuzzy metric space to the problem of Rhoades [16].

**Theorem 3.** Let $f$ and $g$ be noncompatible pointwise $R$-weakly commuting selfmappings of type $(A_g)$ of a fuzzy metric space $(X, M, *)$ satisfying

(i) $fX \subset gX$,
(ii) $M(fx, fy, kt) \geq M(gx, gy, t)$, $k \geq 0$, and
(iii) $M(fx, f^2x, t) > \max\{M(gx, gf x, t), M(fx, gx, t), M(f^2x, gf x, t), M(fx, g f x, t), M(gx, f^2x, t)\}$, whenever $fx \neq f^2x$.

If the range of $f$ or $g$ is a complete subspace of $X$, then $f$ and $g$ have a common fixed point and the fixed point is the point of discontinuity.

**Proof.** Since $f$ and $g$ are noncompatible maps, there exists a sequence \( \{x_n\} \) in $X$ such that

$$\lim_n fx_n = \lim_n gx_n = p$$

(1)

for some $p$ in $X$, but either $\lim_n M(fgx_n, gf x_n, t) \neq 1$ or the limit does not exist. Since $p \in fX$ and $fX \subset gX$, there exists some point $u$ in $X$ such that $p = gu$ where $p = \lim_n gx_n$. If $fu \neq gu$, the inequality

$$M(fx_n, fu, kt) \geq M(gx_n, gu, t)$$
on letting $n \to \infty$ yields

$$M(gu, fu, kt) \geq M(gu, gu, t).$$

Hence $fu = gu$. Since $f$ and $g$ are $R$-weak commuting of type $(A_g)$, there exists $R > 0$ such that

$$M(ffu, gu, kt) \geq M(fu, gu, t/R) = 1,$$

that is, $fu = gfu$ and $ffu = fgu = gfu = ggu$. If $fu \neq ffu$, using (iii), we get

$$M(fu, ffu, t) \geq \max\{M(gu, gfu, t), M(fu, gu, t), M(ffu, gfu, t), M(ffu, ggu, t)\}$$

$$= M(fu, ffu, t),$$

a contradiction. Hence, $fu = ffu$ and $fu = ffu = fgu = gfu = ggu$. Hence $fu$ is a common fixed point of $f$ and $g$. The case when $fX$ is a complete subspace of $X$ is similar to the above case since $fX \subset gX$. We now show that $f$ and $g$ are discontinuous at the common fixed point $p = fu = gu$. If possible, suppose $f$ is continuous. Then considering the sequence $\{x_n\}$ of (1) we get $\lim_n ffx_n = fp = p$. $R$-weak commutativity of type $(A_g)$ implies that $M(ffx_n, ggx_n, t) \geq M(fx_n, gx_n, t/R) = 1$ which on letting $n \to \infty$ this yields $\lim_n ggx_n = gp = p$. This, in turn, yields $\lim_n M(ggx_n, ggx_n, t) = 1$. This contradicts the fact that $\lim_n M(gfx_n, gfx_n, t)$ is either nonzero or nonexistent for the sequence $\{x_n\}$ of (1). Hence $f$ is discontinuous at the fixed point. Next, suppose that $g$ is continuous. Then for the sequence $\{x_n\}$ of (1), we get $\lim_n gfx_n = gp = p$ and $\lim_n ggx_n = gp = p$. In view of these limits, the inequality

$$M(fx_n, gfx_n, t) \geq M(gx_n, ggx_n, t)$$

yields a contradiction unless $\lim_n gfx_n = gp = p$. But $\lim_n gfx_n = gp$ and $\lim_n gfx_n = gp$ contradicts the fact that $\lim_n d(gfx_n, gfx_n)$ is either nonzero or nonexistent. Thus both $f$ and $g$ are discontinuous at their common fixed point.

Hence we have the theorem.

We now give an example to illustrate the above theorem.

**Example 3.** Let $X = [2, 20]$ and $M$ be the usual fuzzy metric on $(X, M, \ast)$. Define $f, g : X \to X$ as

$$fx = 2 \quad \text{if} \quad x = 2 \quad \text{or} \quad > 5, \quad fx = 6 \quad \text{if} \quad 2 < x \leq 5$$
\( g2^2 = 2, \; gx = 7 \) if \( 2 < x \leq 5 \), \( gx = (4x + 10)/15 \) if \( x > 5 \)

also we define \( M(fx, gy, t) = t/[(t + d(fx, gy))] \) for all \( x, y \) in \( X \) and \( t > 0 \).

Then \( f \) and \( g \) satisfy all the conditions of the above theorem and have a common fixed point at \( x = 2 \).

In this example \( fX = \{2\} \cup \{6\} \) and \( gX = [2, 6] \cup \{7\} \). It may be seen that \( fX \subset gX \). It can be verified also that \( f \) and \( g \) are pointwise \( R \)-weakly commuting maps. To see that \( f \) and \( g \) are noncompatible, let us consider a sequence \( \{x_n = 5+1/n : n > 1\} \), then \( \lim_n fx_n = 2, \lim_n gx_n \rightarrow 2, \lim_n fgx_n = 6 \) and \( \lim_n gfx_n = 2 \). Hence \( f \) and \( g \) are noncompatible.

Remark. Aamri and Mourawakil [1] have shown that the property \((E.A)\) introduced by them is more general then the notion of noncompatibility. It is however, worth to mention here that if we take the noncompatibility aspect instead of the property \((E.A)\) we can show, in addition, that the mappings are discontinuous at the common fixed point. Aforesaid results illustrate our assertion in the fuzzy metric fixed point theory. This is, however, also true for the study of fixed points in metric space.
